# 1. Description of the SPIRIT instrument

## Spectral bands of the SPIRIT instrument and excitation temperatures of ions in solar plasma

<b>Spectral band</b>	<b>Main ions</b>	<b>T, 10<sup>6</sup> K</b>
8.418 - 8.423 Å	MgXII	10 - 20
177 - 207 Å	OIV, FeIX-XXIV, CaXIV-CaXVII	0,3 - 16
285 - 335 Å	HeII, SiXI, FeXV-FeXVI, MgVIII, NiXVII, CaXVII	0,05 - 5
171 Å	FeIX - FeX	1,3
175 Å	FeIX - FeXI	1,3
195 Å	FeXII	1,6
284 Å	FeXV	2
304 Å	HeII, SiXI	0,05
304 Å	HeII, SiXI	0,05 - 2

The instrument includes two units:

*SRT-C telescope/coronagraph assembly:*

**Ritchey-Chretien telescope**

with 171, 195, 284, 304 Å bands  
(multilayer optics is analogous  
to the SOHO EIT telescope).  
FOV 42', angular scale 2,4"/pix.

**Herschel telescope-coronagraph**

with 175, 304 Å bands having off-axis  
paraboloids with Mo-Si coating.  
FOV 45', angular scale 2,6"/pix.  
In the coronagraphic mode the instant  
FOV 45" at 2-5  $R_{\text{sun}}$ .

## *RES-C spectroheliograph assembly*

**Two MgXII full Sun bragg crystal spectroheliographs** ( $\lambda = 8,418-8,423 \text{ \AA}$ ) with orthogonal dispersion planes. FOV  $1,3^\circ$ , angular scale  $4,1''/\text{pix}$ , spectral resolution  $3 \cdot 10^{-3} \text{ \AA}$ .

**Two XUV diffraction grating slitless spectroheliographs**, each gives full Sun spectral images in two selectable spectral bands  $177-207 \text{ \AA}$  and  $285 - 335 \text{ \AA}$ . Angular scale  $6'' \times 1''/\text{pix}$ , spectral resolution  $0.03 \text{ \AA}/\text{pix}$ .

# Electronics

Two independent units, each doubled for redundancy

- ❖ Each unit includes 100 MOPS DSP CPU with 32 MB data buffer, 64 KB RAM, 4 KB NVRAM, 8KB ROM;
- ❖ data are going in two independent flows, so images in two different channels may be acquired at the same time;
- ❖ observing sequences may be run by pre-programmed commands or by uploaded command files;
- ❖ allows to upload on-board processing software;
- ❖ compression of images by the Huffmann lossless algorithm, binning 2x2
- ❖ readout time for 1 image 1024x1152 – 2,5 s, exposure times from 0.01 to 600 s, delays from 0.1s to 60 min.

obtained by the SPIRIT Herschel telescope  
on 03/01-2002 at 02:54 UT**

# Full-Sun images in MgXII 8,43 A line ( $T \sim 10\text{MK}$ )

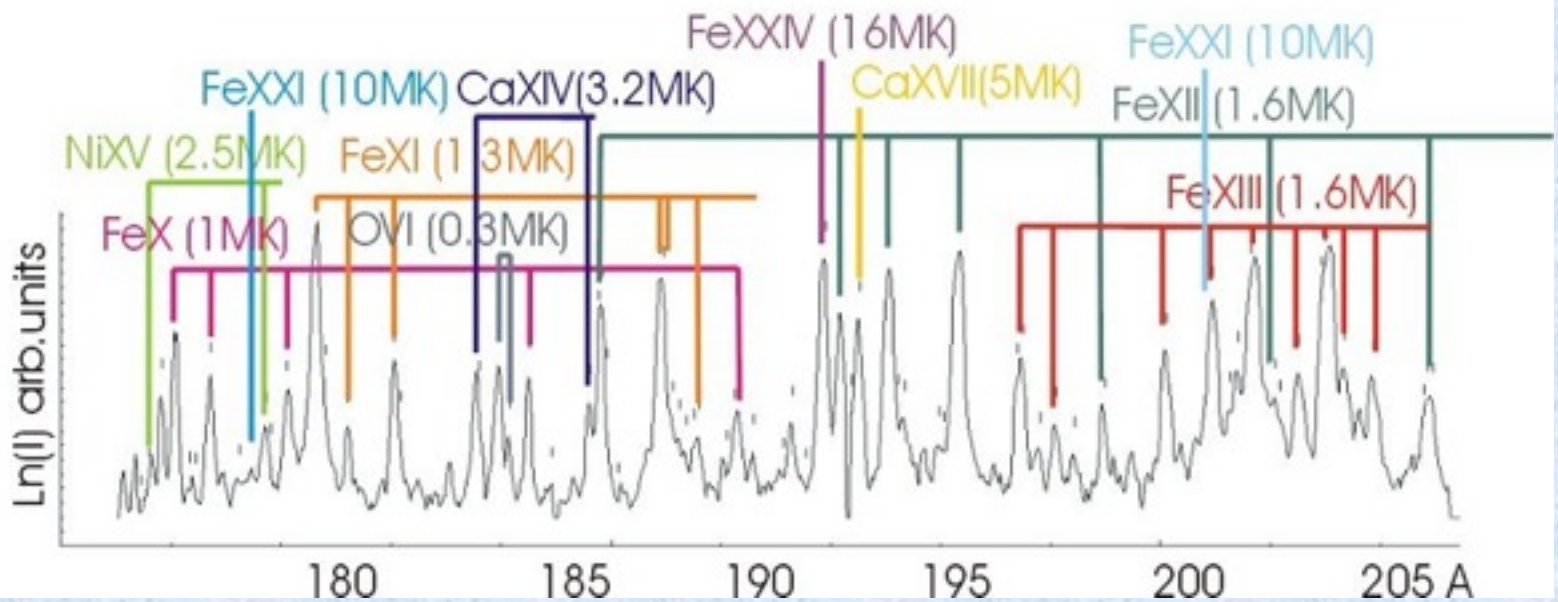

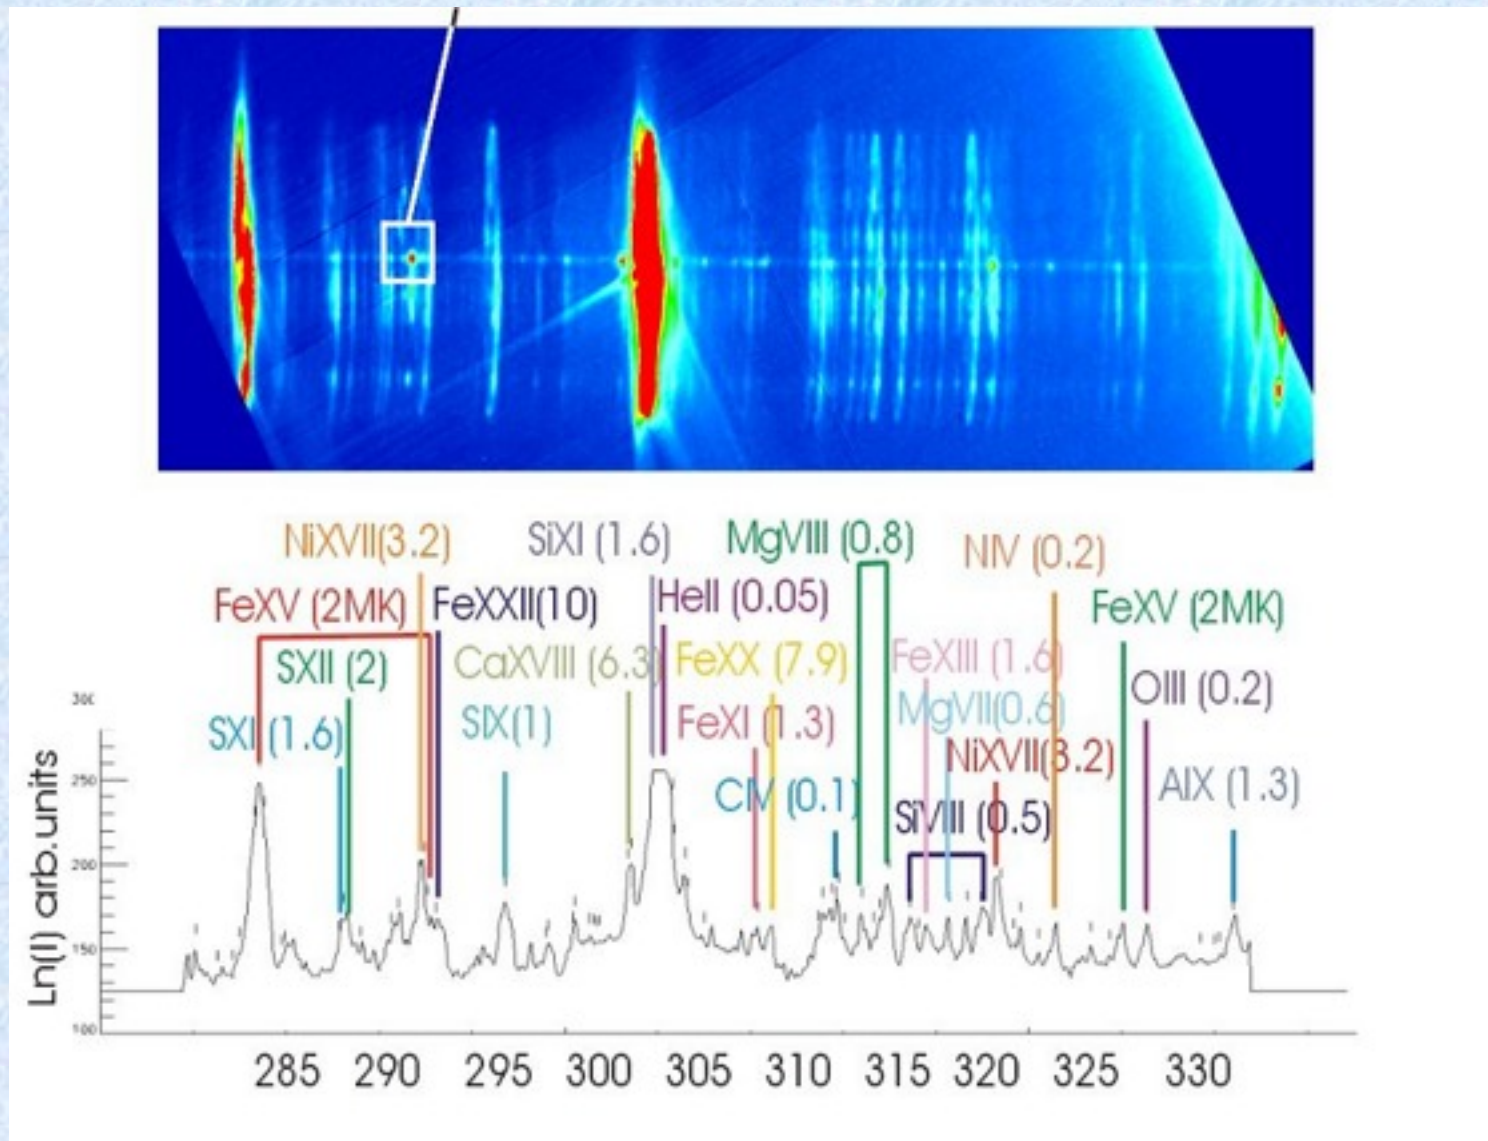

SPIRIT MgXII 8.42A

# XUV spectroheliometer: 177-210A band

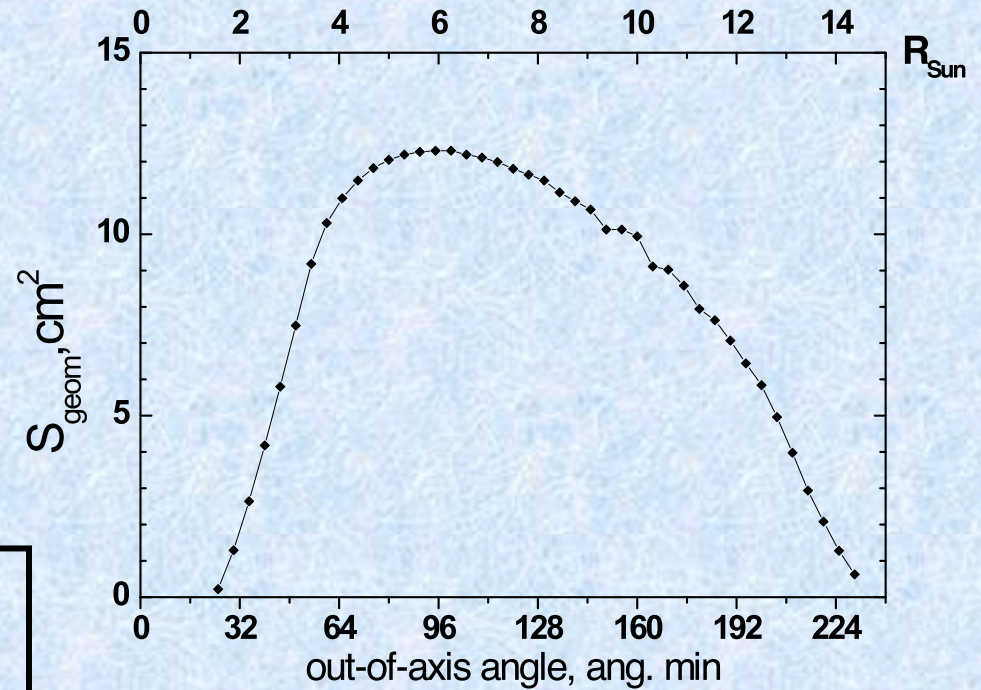

# XUV spectroheliometer: 177-210A

# Observations of solar EUV-corona by the Herschel telescope in the coronagraphic mode

Vignetting function

# XUV-corona after flare (GOES M3, 08/12-01, 06:02-06:55 UT) SPIRIT Herschel telescope/coronagraph

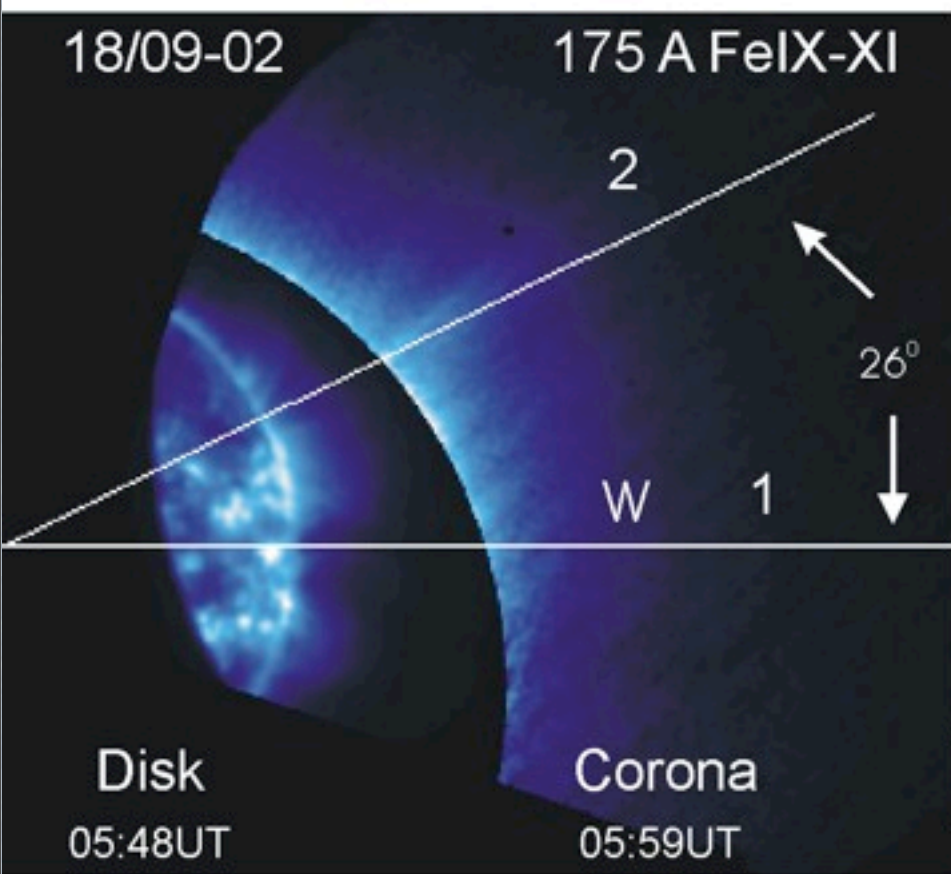

08/12-01 07:24:25 UT

08/12-01 09:03:25 UT

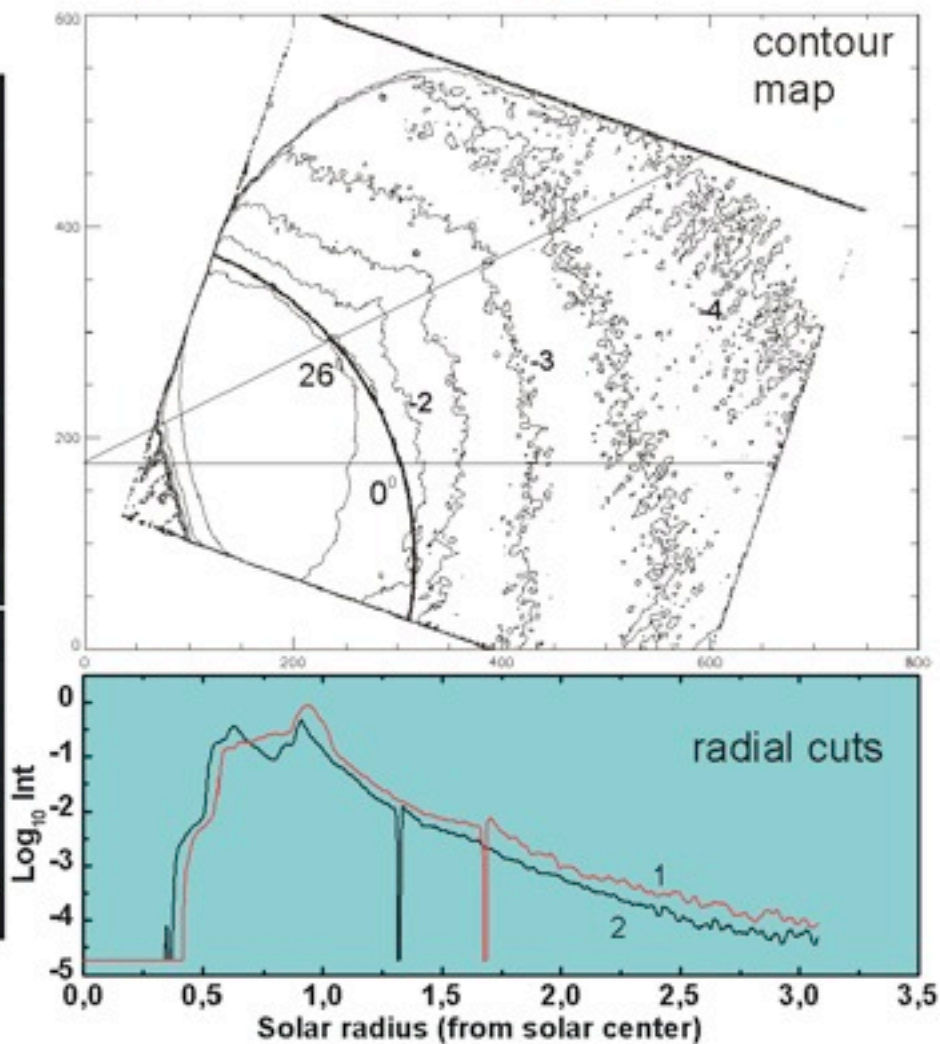

# Observation of solar XUV corona up to $3R_{\text{sun}}$ by the Herschel telescope/coronagraph

A. 175 Å band

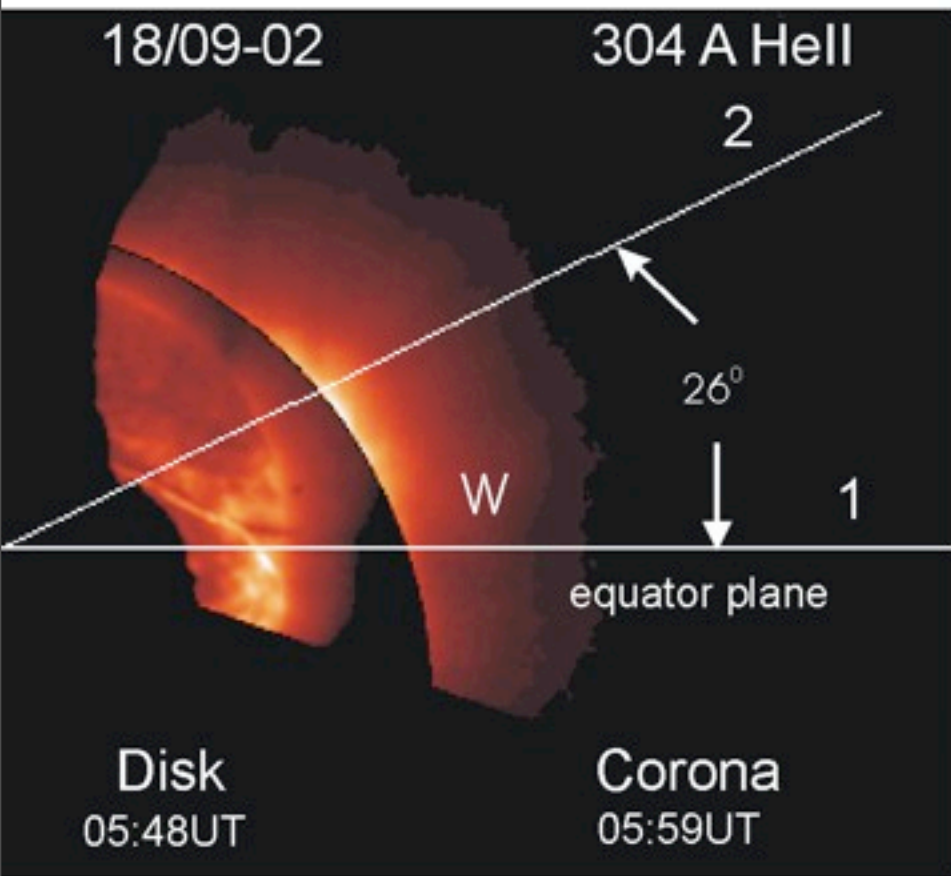

Superimposed images of the disk ("moon" open)  
and the corona ("moon" closed)

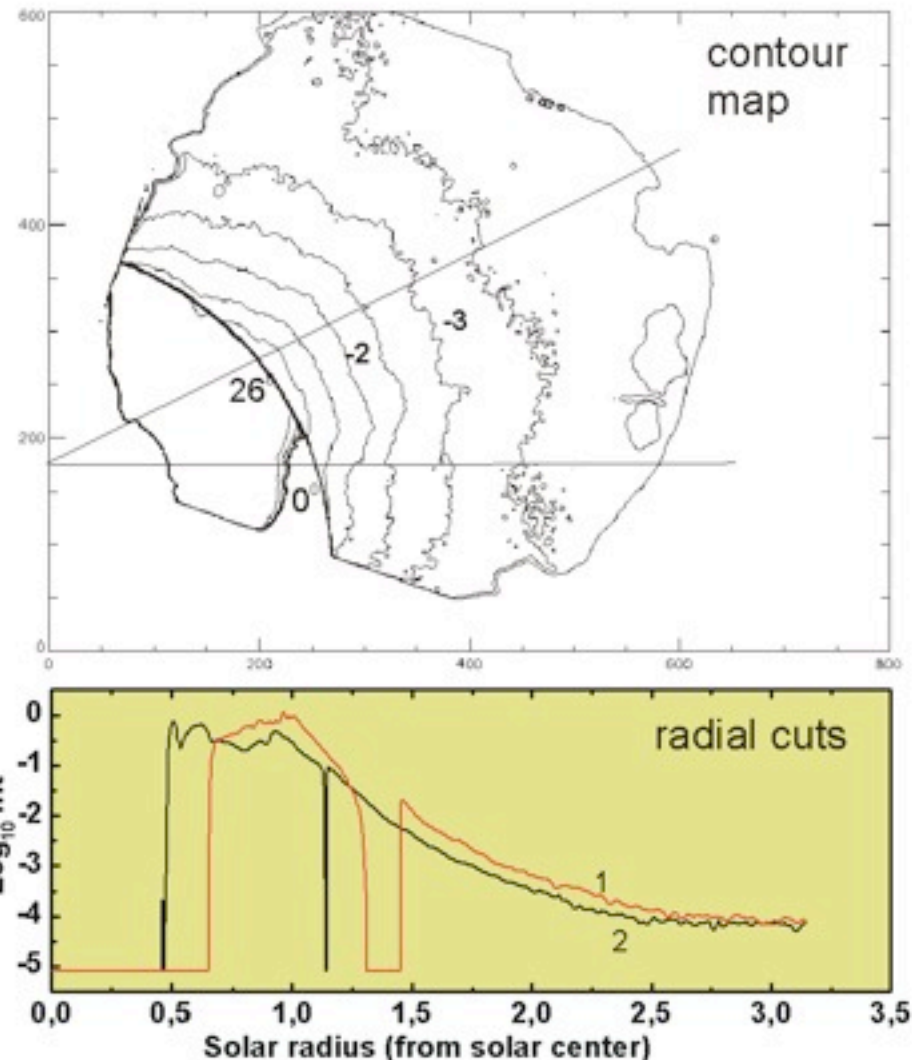

# Observation of solar XUV corona up to $3R_{\text{sun}}$ by the Herschel telescope/coronagraph

B. 304 A band

Superimposed images of the disk ("moon" open) and the corona ("moon" closed)

## **Summary: the main parameters of SPIRIT for solar observations**

Simultaneous full-Sun multi-wavelength imaging in 4 of 7 spectral bands from 8.42 to 335 Å ( $T=0.05 - 10$  MK);

Real temporal resolution up to 5 s (telescope),  
7s (spectroheliometer);

Flexible control – the observing program may be changed up to twice in a day by sending on-board control files;

On-board processing (monitoring of flares)

## **2. Observations on-board CORONAS-F**

### **The CORONAS-F satellite (launched on July 31, 2001)**

Orbit – near circular, init. Alt.  $\sim 500$  km,  
now is 430 km

Inclination –  $83,5^\circ$

Period – initial 94,5 min, now  $\sim 93$  min

Pointing – 2-axis (slow rotating around solar axis)

Drift  $< 2'$  with velocity  $\sim 0,1$  "/sec

Scientific payload – 560 kg

# Observing conditions and limitations

## Orbit with occultation.

Illuminated part - 45 min of 93 min.

Other parts of the orbit are not usable because of  
occultation or atmospheric absorption

Each 3 months there are 2-3 week periods without occultation  
(or with partial occultation).

Satellite roll angle must be restored (Star cameras are used)

## Telemetry volume

only one receiving ground station DLR, Germany

2 dumps a day, a total SPIRIT volume is up to 90 Mbytes/day

(100-400 full format images).

# Observing programs in 2001-2003

## Synoptic observations

in 171-195-284-304A - 4 times a day,  
from July 2002 – at 4, 10, 16, 22<sup>h</sup> (between

EIT)

full Sun , 1024x1024 or 512x512.

in 175/304 A – each orbit with a cadence of  
15-30 min – 512x576.

in MgXII – each orbit with a cadence of 0,5-15 min  
(full Sun or box)

## High cadence campaigns (with EIT shutterless, other SOHO devices and TRACE) Box 12'x12',1x1

4 campaigns #8-11, Oct 02-June 03 (see <http://sol.oma.be>)  
MEDOC campaign of Oct-Nov 2002

## **Observations of EUV-corona**

typical during one-two weeks each 3 months with a  
cadence of 30 min. 512x512

## **Flare monitoring in Mg XII**

~50 runs, needs a lot of TM and commands

## **CME watch in 175A** (during SOHO keyholes)

Sept 22 – Oct 11 2003. 512x576

# 3. SPIRIT data format and processing

## Data processing levels

*Row data* – fits-files (some differences from EIT)

SH171\_031026\_163641.fits, SR304\_031020\_162008.fits,

SMg1\_031025\_175213.fits, SV190\_031025\_045234.fits

*Level 1 processed data*

SAR175\_031023\_193022.fits – bgr illuminated, rotated to solar axes, centered by aligning to reference file

SXH304\_031026\_163621.fits, the same, but individually centered

## Processing software

Equivalent to EIT\_prep software. Now exists only at the Lebedev Institute, soon will be transmitted to MEDOC.

**Intercalibration with EIT - will be soon**

## 4. Access to the SPIRIT data

### SPIRIT data flow
