

Quiet Sun model from Allen (1977)

as described in Vial and Chane-Yook (2016)

The following figures represent half-profiles of 10 Hydrogen lines computed along a line-of-sight located at 1.05 Rs where continuum absorption is omitted.

E is the integrated energy in $\text{erg s}^{-1} \text{cm}^{-2} \text{sr}^{-1}$

Lyman α line, 1215 Å

Lyman β line, 1025 Å

line 1 3 (1025 Å), E = 2.02E+00

H α line, 6564 Å

Lyman γ line, 972 Å

$H\beta$ line, 4862 Å

Paschen α line, 18756 Å

H γ line, 4341 Å

line 2 5 (4341 Å), E = 3.71E-02

Paschen β line, 12821 Å

H δ line, 4102 Å

H ϵ line, 3971 Å

line 2 7 (3971 Å), E = 1.48E-02
